Glossematics and Contemporary
Linguistic Theory

Louis Hjelmslev

Selected Bibliography

- Albert Sechehaye: Programme et méthodes de la linguistique théorique. 1908
F. de Saussure: Cours de linguistique générale. 1916 (and later editions).
Edward Sapir: Language, 1921.
Leonard Bloomfield: Language, 1933.
Karl Buehler: Sprachtheorie. 1934.
Karl Buehler: Die Axiomatik der Sprachwissenschaften. Kantstudien 38, 1933.
N. Trubetzkoy: Grundzüge der Phonologie. Travaux du Cercle Linguistique de Prague 7. 1939. French translation (with additions) by Gauthier: Principes de phonologie.
Roman Jakobson, G. Fant, M. Halle: Preliminaries to Speech Analysis. 1952.
Recent works by Zellig S. Harris, Charles F. Hockett, Kenneth L. Pike, Jerzy Kurylowicz, and others.

Glossematics:

- Louis Hjelmslev: Prolegomena to a Theory of Language. Translated by Francis J. Whitfield. (Supplement to LJAL vol. 19 no. 1. - Indiana University Publications in Anthropology and Linguistics, Memoir 7.) 1953. (New edition forthcoming. - Original Danish version published in 1943.) (Abbreviation: P.)
Louis Hjelmslev: Essais linguistiques. Travaux du Cercle Linguistique de Copenhague 12. 1959. (Collected papers in French and in English, with a complete bibliography of the publications of Louis Hjelmslev.) (Abbrev.: E.)
pp. 27-35: Structural Analysis of Language (first published in 1948; a presentation of the most general principles of Glossematics).
Louis Hjelmslev, H. J. Uldall: Outline of Glossematics. Part 1: General Theory, by H. J. Uldall. Travaux du Cercle Linguistique de Copenhague 10, 1. 1957. (pp. 1-35: General Principles. pp. 36-87: Glossematic Algebra. (Abbr.: CG.)

1. Analytical Procedure (Lectures 1, 2).

2. Functions (Lectures 1, 2, 3, 5).

P 20-25.

	function (a φ b)	relation (a R b)	correlation (a; b)
cohesion	determination ($v \rightarrow c, c \leftarrow v$)	selection ($v \rightarrow c, c \leftarrow v$)	specification ($v \vdash c, c \dashv v$)
	interdependence ($c \leftrightarrow c$)	solidarity ($c \sim c$)	complementarity ($c \perp c$)
reciprocity	constellation ($v \mid v$)	combination ($v - v$)	autonomy ($v \uparrow v$)

analysis (division): description of an object by the uniform dependences of other objects on it and on each other.

function: dependence that fulfills the conditions for an analysis. (Otherwise: OG 36.) Cf EL 114.

relation: both-and function. (In OG 42 this is called connexion.)

correlation: either-or function. (In OG 51 this is called equivalence and has a different formal definition.)

functive: object that has function to other objects.

constant (c): functive whose presence is a necessary condition for the presence of the functive to which it has a function.

variable (v): functive whose presence is not a necessary condition for the presence of the functive to which it has a function.

determination: function between a constant and a variable.

selection: determination between relates.

specification: determination between correlates.

interdependence: function between two constants.

solidarity: interdependence between relates.

complementarity: interdependence between correlates.

cohesion (formerly called connexion): function among whose fun-
ctives appear one or more constants. The constant(s) can be
said to be presupposed by the functive(s) with which they have
a cohesion.

constellation: function between two variables.

combination: constellation between relates.

autonomy: constellation between correlates.

reciprocity: function containing either only constants or only
variables.

incompatibility: absence of function between objects.

catalysis (\geq): registration of cohesions through the replacement of
one /relatively smaller/ entity by another (larger entity) to
which it has substitution (for substitution, see below).

Example: isolated subordinate clause ("if I had money ...") \geq
larger entity consisting of this subordinate clause \rightarrow
an encatalyzed category of principal clauses ("I would go to
the pictures", "I would buy a car", etc. etc.) In particular
cases where the speech situation or situation context permits
adding one definite constant (in the example chosen: one
definite principal clause, e.g. "I would buy a car") instead
of the whole category of possible constants, the category is
said to be resolved, and the catalysis is replaced by an ordinary
interpolation.

class: object that is subjected to analysis.

segments: objects that are registered by a single analysis as
uniformly dependent on the class and on each other. Segments
thus are the resultants of an analytical operation.

synthesis: description of an object as a segment of a class.

A class is said to be generated by the function between its segments.

hierarchy: class of classes.

process (or sequence): relational hierarchy.

system: correlational hierarchy.

language is taken in the ordinary linguistic sense. A hierarchy *which is a language, a* whose structure is fundamentally similar to that of languages, ~~but which is not in itself a language in the linguistic sense~~, is called a semiotic. (These terms are correlational only, see below.)

A semiotic process is called a syntagmatic. A linguistic syntagmatic is called a text.

A semiotic system is called a paradigmatic. A linguistic paradigmatic is called a language.

A process consists of chains. Chains that are generated by a definite relation are called units.

Examples: A complex independent clause (sentence) can through a synthesis be shown to be a unit generated by the selection between a modulation (often manifested by an intonation) as the constant and the modulation-theme as the variant. This is a practical glossematic definition of a synthetic independent clause (sentence).

A complex modulation-theme can through a synthesis be shown to be a unit generated by the selection between a 'principal clause' as the constant and 'subordinate clause(s)' as the variable.

A syllable can through a synthesis be shown to be a unit generated by the selection between an accent (often manifested by a degree of stress or by a particular pitch) as the constant and the accent-theme (or syllabic theme) as the variable. This is a practical glossematic definition of a (synthetic) syllable.

A syllabic theme is, in its turn, generated by the selection

{ consonant unit } → { vowel unit }

(often manifested by contoid clusters (or simple contoids) and vocoid clusters (or simple vocoids), respectively).

A system consists of paradigms. Paradigms that are generated by a definite correlation are called categories. - Paradigms (and categories) may be represented graphically by vertical columns.

forming a right angle with the chain, so that each member of a paradigm can be said to take the same "place" in the chain as the other members of the same paradigm (cp. the single pictures in a moving film-strip).

Direction (and government): E 139-164. (Lecture 6)

3. Commutation and Substitution. Content Plane and Expression Plane.
(Lectures 1, 2, 4.)

The commutation test is carried out within one and the same paradigm (or category, respectively). Glossematics does not start from minimal elements (e.g., "phonemes") (cf. 1: Analytical Procedure) but from the largest possible chains. Thus, there is no distributional procedure required.

If the replacement of one member of a paradigm in one plane of the language (content plane or expression plane) can entail some replacement in the opposite plane (expression plane or content plane, respectively), then the two members are recognized as commutables (invariants) or as having mutual commutation (symbol: ;).

If the replacement of one member of a paradigm in one plane of the language cannot entail a replacement in the opposite plane, then the two members are recognized as substitutables (variants) or as having mutual substitution (symbol: inverted semicolon ;).

Examples: Commutation in the content:

'he' ; 'she' in English (expressed by he, she)
'he' ; 'she' in Chinese (expressed by -ta:), Finnish
(expressed by hän), Hungarian (expressed by ő);

Commutation in the expression:

s ; z in English
s ; z in Danish
p ; b in English
p ; b in Finnish

P 46-47, 25-38.

E 36-68, 82-88, 89-95, 96-112, 121-2.

A syncretism (neutralization) is the result of a suspended commutation. Syncretisms are either coalescences (as p/b in Danish at the end of a syllable, and similarly in Russian) or implications (e.g. the mechanical replacement of z by s in English in cases like "cats", "puts").

The two planes have mutual solidarity.

A sign consists of a sign content and a sign expression with mutual combination (allowing for the existence of synonyms and homonyms). - A sign expression corresponds to what in conventional terminology is known as a "form", and to what in Prague terminology and in ordinary American terminology is known as a "morpheme".

4. Form and Substance (lectures 3, 6).

E 27-81.

P 31-2, 34-5, 47-51, 61-2, 65-8.

manifestation: selection between hierarchies and between derivatives (segments and segments-of-segments) of different hierarchies.

form: the constant in a manifestation.

substance: the variable in a manifestation.

The content substance is of semantic nature. The expression substance is of phonic, graphic . . . nature. Note that, according to glossematics, phonemes, as well as phones, belong to the expression substance, whereas substitutables in both planes belong to the form.

Content substance, content form, expression form, and expression substance are called the four strata.

usage: any relation between different strata and between parts of different strata.

5. Exhaustive Description (Lecture 4).

P 62

6. Synchronic and Genetic Linguistics (Lecture 4).

E 19-20

Genetic Linguistics is divided into diachronics (change of elements) and metachronics (change of systems). - Genetic ("historical") Linguistics is of a descriptive nature (like any scientific treatment).

Genetic functions: The function between linguistic states, considered as evolutionary stages, is a specification, with the relatively older stage as the constant. - The functions between coordinate, mutually genetically related linguistic states are combination and complementarity.

7. General Typological Calculus (Lecture 4).

The function between a relatively special and a relatively general type of semiotic is a selection, with the relatively general type as the constant. - The function between different types of one and the same hierarchic stage is a complementarity.

8. Denotation and Connotation. (Lecture 4).

P 73-6

A connotative semiotic is a semiotic whose expression plane is a semiotic.

Examples: Styles; national languages.

9. Metasemiotics (Lecture 4).

P 76-80

A metasemiotic is a (scientific) semiotic whose content plane is a semiotic.

Examples: terminologies; linguistics.

Some of the definitions and statements given above should be taken as practical approximations only.
